

SnappingGecko is a free Grasshopper plugin which provides object snapping features, helping you to keep your definitions clean.

This plugin has been thought for users by user : While growing up, Grasshopper definitions always tend to get as messy as a noodle plate ! SnappingGecko brings you the possibility to align components while moving, assisted by magnetic guides to the sides or centers of other close components, or aligned with the cables linked to the moving component.

SnappingGecko can be entirely customized (changing guides color, line type, thickness, strength, ...) to fit your Grasshopper experience straight from the Grasshopper Preferences dialog.

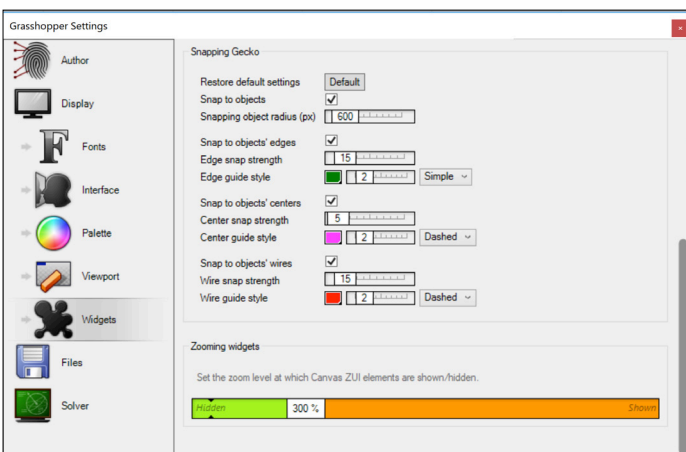

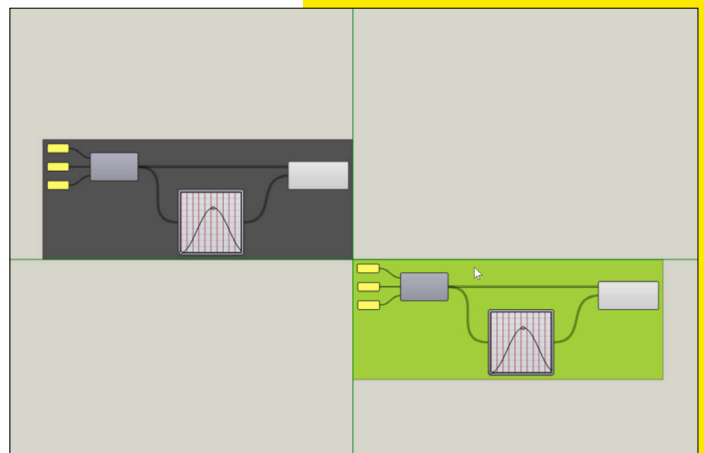

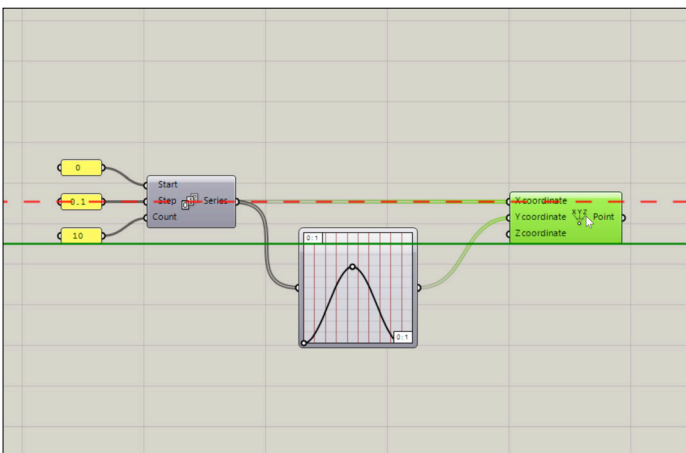

It also comes with a new menu, providing fast access to the main features and can even support keyboard shortcuts.

## Definitions organization

Get rid of "noodle plate" definitions. Magnetic guides will help you to easily organize your developments.

## Customizable guides

Everyone works differently. Guides can be selectively disabled and are fully customizable.
